
Pre-policy: leave-one-period-out prediction gaps, native normal 95% CIs (B=200).
Post-policy: full-model effects, basic bootstrap 95% CIs (B=1,000). All intervals are pointwise.
Raw counts, r=4, log population, no size weights; 409 origin ODs; morning use (06:00-10:00).
Pre-policy points in B are held-out predictions, not differences between the fitted lines in A.
